

CloudSphere Technical Support

Included Documentation:

- **Company Branding Kit:** contains company and app logos, case import file and branding brief with instructions for email templates.

Create a developer edition org in order to complete this project.

Background

CloudSphere is a leading tech company that provides scalable cloud services, enabling businesses of all sizes to store, manage, and process data efficiently in the cloud. Their solutions include cloud storage, computing power, and security features designed to optimize operations and enhance collaboration.

As demand for cloud services surged, CloudSphere faces an increase in challenges optimising their Technical Support cases. Performance issues and slow response times during peak usage periods led to increased customer dissatisfaction. Businesses relying on CloudSphere for critical operations experienced downtime, which impacted their productivity and trust in the platform.

To remedy this issue CloudSphere is revamping their Tech Support team and is implementing a 3-tiered support system to ensure all customer tickets are resolved in a timely manner.

As the Salesforce Administrator, you've been tasked with the setup of the new team members and implementing the necessary processes to optimise and automate the support process.

Part 1: Support Processes and Record Types

Objective: Implement an appropriately tiered ticketing system using custom support processes and ensure cases are assigned to the correct team according to the recorded customer tier .¹ Setup the necessary case assignment and escalation processes according to the table below.

1. Create a custom record type named: External Tickets and ensure that the following fields are available to users when customising your page layout (these fields must be included in order to ensure data import will be successful):
 - a. Case Reason
 - b. Case Owner
 - c. Tier Name
 - d. Account Name
 - e. Contact Name

¹ Requirement 1

2. Design and implement a new support process that allows for the submission and management of tickets according to a 3-tier system.
3. When cases are submitted, they should automatically be assigned to the correct team and prioritised according to the tier. I.e. higher tier tickets should aim to be resolved more quickly than lower tier.
4. The ticketing system should have a path displaying the stage of the ticket. Include stage specific guidance for success that will help your users understand what they need to do at each stage.
5. Tickets that are unresolved after a certain time should be escalated accordingly.
6. NOTE: Ensure that non-business hours do not impact the case resolution and escalation times. Tickets should only be worked on during business hours.
7. Business Hours should be Mon-Fri, 8am-5pm. Holidays should also be specified where necessary.

Tier (Priority Level)	Estimated escalation time (based on when the case is first submitted)
Tier 1 (Highest-level Priority)	4 Hours
Tier 2 (Medium-level Priority)	16 Hours
Tier 3 (Low-level Priority)	24 Hours

Part 2: Service Cloud Setup, Configuration & Layout

1. Create a custom app for the Tech Support team named: External Technical Support.
2. Ensure the app branding is in accordance with the CloudSphere Branding Kit provided and include an app description.
3. App Customisations: ²
 - a. Navigation Style: Console Navigation
 - b. Supported Form Factors: Desktop & Phone
 - c. Setup Experience: Service Setup
 - d. App Personalization Settings: Use Omni-Channel Sidebar
 - e. Add appropriate utility items
 - f. Ensure users have access to the following items in the Ticketing App: Accounts, Contacts, Macros and Tasks.
 - g. Make sure the System Admin, Sales and Support users have access to this app.

Part 3: User Setup & Permissions

Objective: Demonstrate the correct use of license and permissions assignment according to the users' roles. ³

² Requirement 2

³ Requirement 3

1. Clone the Custom: Support Profile and name it: Tech Support User
2. Create a new user with the 'Tech Support User' profile and enable 'Service Cloud User'.
3. Assign a role that matches the user license and profile.
4. Customise this type of user's security settings according to the specifications provided below.

Login Hours	8am - 5pm
Session Timeout	90 mins of inactivity
Password Complexity	Include alpha, numeric and special characters

Part 4: Case Generation & Assignment

Objective: The CloudSphere Tech Support team will primarily handle cases via email but they also have the option of contacting customers over the phone for better troubleshooting. Ensure the proper features are in place for customers to submit tickets via the necessary channels.⁴

1. Enable email-to-case and on-demand service.
2. If new emails exceed the email rate limit, ensure the requeue message is enabled too.
3. Create a professional email template that includes the specifications included in the Company Branding Kit.
4. Set up a company forwarding address (this is where cases will be sent to). Include an auto response to confirm the customer's case was received. Note: Create a dummy email to use for this step.
5. Make sure a default case owner is assigned to ensure that cases that do not meet the assignment criteria are sent to the default owner.
6. Cases that are recorded via phone or email should have the same default owner.

Part 5: Data Management & Analytics

Objective: CloudSphere's management team would like to monitor the effectiveness of the processes that have been implemented on the time it takes for cases to be resolved.⁵

1. Import the file: [customsupportcases.csv](#) using an appropriate data importing tool.
2. You are required to create 2 reports:
 - a. A report named Closed Cases by Tier, this will display the total number of closed cases according to each tier, together with the number submitted cases for the last 30 days.
 - b. A report named Case Resolution Time by Tier, this one will display the average resolution time for cases on each tier that will be used to ensure high priority cases are prioritized as required.

⁴ Requirement 4

⁵ Requirement 5

3. Create a dashboard (that should also be displayed on the app home page) that:
 - a. Will shows the amount of open cases for the past 7 days).
 - b. It also needs to show the average time taken to close cases according to each tier.

Part 6: UI and UX Optimisation

Objective: Ensure that the branding for your app and any company communication is consistent and looks professional. The application UI should be optimised for all users and ensure only the required information is displayed, where necessary.⁶

1. Create a custom Home Page for your app that is optimised for the Tech Support User.
2. Ensure branding for the company is in accordance with the Company Branding Kit.
3. The page layout for records should contain all necessary fields and be Dynamic Forms Enabled.
4. The Dashboard/Widget created should be appropriate for the data you're displaying to the user.

Optional:

Objective: This section is not required but is an optional step in testing your understanding of the case study.

1. Provide a one page document describing how the processes you've implemented have solved the problem and the outcome of these solutions. Must include documentation and process flow diagram?

Deliverables:

1. A one page document with a brief explanation on your thought process, challenges you've experienced during the project and the solution you've come up with or how you've solved the problem.
2. Please save the document under the following name format when submitting: yourfullname-proj1.docx (i.e. veroniquenappie-proj1.docx)
3. Login details for the org (included on the same document)

Learning Outcomes:

1. Analyse a case study and properly configure Service Cloud features to align with organizational needs and processes.
2. Understand how to create and customize record types, including their fields and page layouts, to fit specific business requirements.
3. Understand the process of setting up and managing user roles, profiles, and permissions to control access to various system apps and components.
4. Master the configuration of email-to-case functionality and ensure email-based case creation adheres to business rules, including requeue messages for excess case volume.

⁶ Requirement 6

5. Learn how to create professional email templates and set up auto-response features for customer communication.
6. Gain proficiency in importing and cleaning data using tools like Data Import Wizard or Data Loader to handle case data, including deduplication.
7. Understand how to generate and manage reports related to case resolution, case closure times, and customer service effectiveness.
8. Learn how to create a custom, user-friendly home page and optimize the user interface for the Tech Support team.
9. Apply best practices for UI/UX design by ensuring branding consistency, dynamic forms, and the appropriate display of data within the app.
10. Gain a thorough understanding of how the support processes and case management system can be optimized to reduce response times, improve customer satisfaction, and increase operational efficiency.
